

## How the Arctic Became White: Victorian Explorers and the Erasure of Botany in the Canadian Arctic

Chris Gismondi

Many of us “southerners” or *Qallunaat*, as we are commonly referred to in Inuit vocabulary, imagine the Arctic lands as a barren snowscape. At the historic roots of this perception, I see the visual culture of Arctic exploration throughout a long nineteenth century, which represented the Canadian Arctic as devoid of its diverse flora. How could explorers misrepresent the Arctic as desolate when iconic tundra plants like Labrador tea, cottongrass, or wildflowers bloom seasonally? I situate Qallunaat exploration in wider Indigenous territories of what we now call Canada in order to challenge the colonial perception of these “new” lands and settler uses of native technologies. Understanding how explorers framed the Arctic as lifeless helps us comprehend perceptions of it today, which is crucial since climate change renders the polar region increasingly important in Qallunaat-settler geopolitics and extractivism.

On 5 May 1855, Hudson’s Bay Company fur trader James Green Stewart (1825–1890) wrote in his diary while searching for the missing Franklin expedition on the Back River: “the scenery here is a little diversified by the

round hills and green colour of the moss at a distance one would fancy it was grass. The dwarf birch too adds a little to the deception." While the tundra vegetation was playing tricks on Stewart, the larger deception was how explorers, publishers, and newspapers represented the Arctic to the reading public. Simplistic images of snow and ice accompanied romanticized narratives. Robert David likens Europeans trapped in an Arctic "cultural creation" to the phenomenon of Orientalism.

This misrepresentation came at the expense of the environment, in favor of a narrative of Western-Qallunaat technological superiority and to exaggerate white masculinity's accomplishments. This barrenness bolstered explorers' presence in the Inuit homeland, and the construction of vastness fueled Qallunaat interests like imperial sovereignty, searching for the Northwest Passage, and extractive industries of whaling and fishing.

Ironically, explorers omitted plant life from their images, even while botanical samples were collected on these same voyages. Historian Trevor Levere raises this contradiction and places botanists William J. Hooker (1785–1865) and his son Joseph Dalton Hooker (1817–1911) at the center of imperial scrutiny. Both were well-connected with Victorian-era Arctic explorers through correspondence; e.g., a botanic drawing of *Coptis asplenifolia* or Fernleaf Goldthread, a plant native to northern British Columbia and Alaska, served as the background for a letter between William Hooker and the explorer John Richardson (1787–1865). The drive to understand the world through the ascendant sciences had explorers like Richardson, James Ross, John Franklin, and many others boasting about their specimens on returning to the metropole.

The botanical absence in popular Arctic images occurred as environmental specificity was redirected to emphasize accomplishment, grandeur, and technological superiority. Representations routinely show men traversing the land and ships sailing among icebergs. Thus, they break the norms of the unpeopled landscape tradition familiar in Canadian culture. Richard Dryer and Scott Morgensen both locate white-colonial masculinity around achievement and enterprise. However, the explorers' success was dubious and reliant on Indigenous expertise. Heather Igloliorte describes Inuit knowledge (or Inuit *Qaujimaqatunngit*) as "living technology ... knowledge embedded in practice." These Indigenous technologies, like the Inuit dogsled, were crucial for expedition success. An 1836 newspaper clipping from the HBC archival holdings demonstrates this when George Back comments on his upcoming expedition from Lake Winnipeg to Great Slave Lake: "this track is well known to the Chipewyan Indians, whose authority is much more to be dependent upon than the public hitherto been led to believe." Historian Ken McGoogan highlights how explorers' accomplishments continually came about with the aid of Indigenous people and their technology, which disrupts the notion that white men succeeded in exploration by their own will, hard work, or technological means.

Steve Garlick has theorized that masculinity itself must be understood as a technology of domination: "Technology is associated with the masculine because masculinity itself is a (modern) technology for the embodiment and control of nature." Experienced on *terra firma* and at extracting wealth from the sea, men of industry like William Penny (1809–1892), founder of the whaling enterprise the Aberdeen Arctic Company, exemplify this. Beyond gender, I refute the idea that only white Qallunaat-settler men can claim their tools as technology. Contrary to such a notion, expedition culture constantly relied on Indigenous people, their tools,

and knowledge for their survival and success. John Richardson left advice to the departing Franklin search expeditions that European boots would prove useless, inviting frost bite and hypothermia. He recommended trading for *kamik* boots and learning how to fashion snow goggles. Likewise, in 1771 George Cartwright lost his Governor Surgeon to the cold in northern Labrador, later remarking at the warmth of being in an igloo lit only by a stone oil lamp or *qulliq*.

On account of the Arctic's remoteness, its perception by outsiders has always been mediated heavily through contemporary images or in historic print culture. Today, the north remains a romantic symbol. Its perception is important to constructed narratives complicit in inaction on climate change, settler-colonial nation-state sovereignty, resource extraction, or assaults on sustainable practices like seal harvesting. These Qallunaat myths around the Arctic environment and Inuit life are well documented by Chelsea Vowel and Emilie Cameron, referencing Inuit relocations and other colonial violences. The region remains a vibrant Inuit homeland with a thriving and delicate animal and botanical ecosystem, one which has been largely erased in colonial landscape historiography.
