

The Trees of Tavrishesky Garden: Forgotten Actors in the Politics of Cultural Landscape

Lewis Purcell

Summary

Scholars are turning their attention to the politics of cultural landscapes including urban parks; however, trees and natural vegetation are left out of their analysis. This article uses the Tavrishesky Garden of St. Petersburg's historic downtown as a case study. Since its creation in the 1790s, Tavrishesky's trees and vegetation have represented the government's political values. Twentieth-century restoration projects, including the planting of greenery to "return" the park to its original format, used the trees in a similar way: to convey the political values of the state.

Though scholars have recently turned their attention to the politics of cultural landscapes, they largely continue to neglect the importance of trees in this statecraft. Politicians, however, do not. In fact, trees in the largest park in St. Petersburg's historic downtown—Tavrishesky Garden—recently took part in Putin's most important public memory project: immortalizing the patriotic narrative of Russia's victory in World War II. A closer examination of the trees of this park reveals them to be intrinsic actors, both past and present, in the political use of landscape.

In 1703, Peter the Great wanted the gardens of his new capital, St. Petersburg—Russia's "window to Europe"—to resemble the gardens of the courts of Western Europe which were used to enhance political and social status. European spruce (*Picea albies*), Scots pine (*Pinus sylvestris*), and birch trees (*Betula spp.*) naturally dominated the area where he later built his city. But Peter imported deciduous trees (e.g., oak, linden, maple, and elm) which resembled those found in Western European gardens, which he considered more "cheerful." Fast-forward nine decades and "European" vegetation had replaced most of the area's original greenery. Catherine the Great continued Peter's Europeanization policies. And when Prince Potemkin, her most influential advisor (and lover), built Tavrishesky Garden adjoining his new palace in St. Petersburg, he hired Englishman William Gould to design the park in the English landscape style. At its heart was a manmade pond, canals, and islands surrounded by hilled embankments and thousands of newly planted trees—the descendants of Peter's "European" trees. Thus, from its inception, the greenery of the park promoted the political visions of its founders.

Painting, dated 1797, by Swedish artist Benjamin Patersen: “View of the Tauride Palace from the Garden Side”

In the 1860s the Gardens were first opened to the public. By the Revolution of 1917, their landscape had changed decidedly as the park was partitioned into various sections run by an odd mix of state-supported voluntary associations and for-profit ventures, reflecting the economic and social development of the capital city in the late Tsarist period.

In the early Soviet period, the park’s vegetation remained largely untouched. However, the 900-day Siege of Leningrad during World War II left millions of dead and wounded. Popular histories record Tavrishesky’s trees as victims of the Nazi air raids and artillery bombardments. During the War, the Soviet government renewed Tsarist motifs of Russian nationalism in its identity politics. The State’s intensive efforts to undo German destruction and perfectly restore historic monuments, including landscape gardens, played a significant role in these new politics. After the War, Tavrishesky’s vegetation played an important part in the work of “restoration” of the park to its “pre-Revolutionary condition.”

In 1972 the vegetation found a new way to participate in statecraft. That year, to commemorate their jubilee, the Young Pioneers (the primary children’s organization of the Soviet Union) planted an avenue of 50 young oaks called the “Allée of 50-years of Pioneering.” They placed an exhibit adjacent to each tree that told of the Pioneers’ history and achievements. Even after the commemorative events, these trees stood as monumental markers to this celebration. Importantly, the 1970s represented a new page in the USSR’s environmentalism. At this time, articles about Lenin’s love of nature appeared throughout the nation’s newspapers, and socialism was promoted as being inherently more conservationist than capitalism. Thus, the Pioneers’ oaks can be seen as proudly socialist, too.

Fewer than two decades later, social, political, and economic upheaval roiled the country. The park’s greenery suffered as much as the general population. Luckily for the trees, the city government, stimulated by financial and logistical aid from the government of Denmark, repaired the park just in time for the city’s 300th birthday. They worked to meticulously “restore” the park to its “golden era” at the turn of the previous century, by practicing “restorative nostalgia”: a post-Soviet practice of indiscriminately replicating nineteenth-century forms in the early twenty-first century. It sprung from a nostalgic yearning among Russia’s political elite for positive historical narratives to replace the pessimistic narratives that dominated Yeltsin’s Russia. The restoration of the garden in 2003 included the planting of hundreds of trees—elms, oaks, lindens, ash, maples, and birch—and thousands of other bushes. To conclude the restoration, national and international politicians gathered to plant another allée. A high-ranking federal official spoke before the event. He declared: “We will plant trees tying together into one the past, the present, and the future.” These newly-planted trees represented the state’s newly-proposed vision of the past.

The trees of Tavrishesky continue to march through history as important actors in cultural landscapes. During the last decade, bureaucrats planted three new avenues of trees in Tavrishesky, each with their own plaque. One reads: “In commemoration of the 70-year Anniversary of the Great Patriotic War 1941–1945.” Putin’s state thus tries to identify these lindens and lilacs with its most important public memory initiative: monumentalizing heroic narratives of World War II. The greenery of St. Petersburg’s Tavrishesky Garden is part of Russia’s political and social history. The trees and vegetation of urban parks are actors in their own right and deserve a page in the history books.
