

The Brazilian *Campos* in Nineteenth-Century Landscape Art

André S. Bailão

Summary

The mosaic of tropical grasslands, savannahs, and woodlands in the Brazilian Highlands, commonly called *campos* in the early nineteenth century and *Cerrado* nowadays, was depicted by European traveling artists and naturalists following new modes of visualization in arts and sciences, in dialogue with Alexander von Humboldt. Illustrations in travel albums presented landscapes following sensorial experiences from the journeys and physiognomic and phytogeographic features studied in the field. They document the transformations of the territory by the advancing settler colonization, with a strong focus on cattle ranching, hunting, and burning of the grasslands.

Traveling naturalists and artists took advantage of the opening of Brazilian borders in 1808 by the Portuguese Crown, which moved to Rio de Janeiro during the Napoleonic Wars. They were interested in describing, botanizing, and collecting in a country that remained mostly unknown outside the Portuguese Empire. Most travelers remained on the coast, especially in Rio de Janeiro, which resulted in multiple accounts and images of the surrounding rainforests and coastal landscapes. The inner Highlands (*planalto*) of Central Brazil were more difficult to reach due to long distances and travel conditions but some visited the mining districts, where the coastal rainforests (*Mata Atlântica*) change into drier vegetations as people advance towards the interior.

Early nineteenth-century inhabitants and naturalists used a rich lexicon of words to refer to the variety of vegetation types of the Highlands. *Campos* was a common term for the mosaic of grasslands, pastures, savannahs, and woodlands in a region characterized by rainy summers and dry winters—now called the *Cerrado* ecoregion. It has been occupied for millennia by native peoples and since the eighteenth century by European settlers and enslaved and freed Africans and their descendants, who were attracted by mining and cattle ranching. This accounts for the hybrid aspect of the vegetation, with plants adapted to natural fires and the ranchers' annual fire regime, and the intrusion of invasive grasses—processes that the French botanist Auguste de Saint-Hilaire and the Danish naturalist Peter W. Lund were already documenting at the time.

Changes in visual culture and natural history stimulated the production of picturesque images of typical landscapes, related to the publication of illustrated travel accounts, discussed by art historians Bernard Smith, Barbara Stafford, and Ana Maria Belluzo. Alexander von Humboldt (1769–1859) played an important role in

renewing the European interest in the tropical Americas with his ideas for composing holistic views of nature, favoring botanical-geographic studies of particular places combined with sensory experiences from the field, in dialogue with travelers. Although iconography of the Brazilian Highlands at that time depicts most often towns, two Bavarian travelers are among the few who recorded the vegetation of this region, as well as its environmental transformations—in direct exchange with Humboldt.

The botanist Carl Friedrich von Martius (1794–1868) traveled to Brazil with Johann Baptist von Spix (1781–1826) as part of a scientific expedition (1817–1820) financed by the Bavarian Crown, visiting several parts of the country. The artist Johann Moritz Rugendas (1802–1858) traveled in 1822 as part of an expedition of the Russian Academy of Sciences, directed by naturalist Georg von Langsdorff—but later left it, spending months in the mining province of Minas Gerais. An illustrated album for Martius and Spix’s *Travels in Brazil* was produced in Munich from Martius’s drafts. Rugendas’s *Voyage Pittoresque dans le Brésil* [Picturesque voyage to Brazil] contains lithographs produced at a Parisian printing house with his involvement. Rugendas also collaborated with Martius, producing landscape illustrations for his botanical compendia *Historia Naturalis Palmarum* and *Flora Brasiliensis*.

Geographers Felix Driver and Luciana Martins have discussed the intense production of a “tropicality” by travelers—the tropical regions as an elsewhere to the temperate world—a process characterized by generalizations but also by the typification of particular landscapes. So how were the Brazilian Highlands particularly characterized?

Eighteenth-century Portuguese expeditions produced images of the region focusing on geographical aspects, such as forested rivers and human settlements, or botanical and zoological studies of individual species. Nineteenth-century naturalists were the first to illustrate the Highlands according to their physiognomy, combining vegetation, fauna, topography, geology, and human activities. According to Barbara Stafford, the new visual language of natural history at the time focused on geological change, which could be interpreted from strange rock formations, eruptions, and the shape and organization of mountain ranges. In an illustrated mountainous landscape of Minas Gerais in Spix and Martius’s *Travels in Brazil*, we see geological and topographic features, strange rocks jutting out from the soil, with a few typical bushes and trees dotting the image.

In Rugendas, images of rainforests and *campos* advance Humboldt's ideas, combining sensory experiences from the journey with a special focus on the diversity of tropical vegetations. Travelers mention the good feeling of leaving the dense rainforests, coming out into the vast grasslands, and his images of forests show a dark, enclosed, and chaotic plethora of plants, while the *campos* were illustrated as vast stretches towards the horizon with clear skies, presenting the feeling of immensity travelers described in their texts.

They annotated the changing visual characteristics of a variety of landscapes as they traveled from one to next, selecting elements to produce different environmental histories of each region. Rainforests are presented as a virgin landscape, despite the presence of human inhabitants, with fallen tree trunks serving as natural bridges and palm trees as columns, as in a timeless Golden Age. On the other hand, images of *campos* are filled with carefully studied grasses, bushes, and palm and pine trees, but also documented the advancing colonization of the Highlands. Rather than just static vegetation, there is movement in the scenes in the shape of cattle ranching, hunting, the burning of grasslands, and travelers' activities, such as collecting natural specimens. In these vast expanses, action falls on men dominating bulls, wild birds, and grasslands with lassos, weapons, and fire. These images have since been circulating among Brazilian cultural elites and eerily anticipate contemporary environmental attitudes towards the *Cerrado*, most often imagined as an open land for agribusiness exploitation.
