When Albert Rothschild came to visit his summer and hunting residence in Holzhüttenboden, the first thing was to saddle his horse and ride to his favorite place named “Goldplatzl” (Golden Place) within his beloved hunting ground in the now called “Urwald Rothwald.” Here and there, even today, the remains of the riding paths that were created for him can still be seen within this primeval forest located in the Northern Limestone Alps, a mere two-hour drive from Austria’s only megacity and capital, Vienna. He had bought the land from an industrial forest company in 1875 and had decided—as the wealthy landlord he was—that the remaining 420 hectares of wilderness had to be left alone and saved from forest use. He was not only a keen hunter but also a

nature lover and a pioneer of photography. Without him, the precious piece of wilderness would have been lost. But why did this forest persist untouched through time, while almost all other forests in similar elevation had been exploited for the iron industry in the eighteenth and nineteenth centuries?

First of all, it is located in a truly remote place between the modern-day provinces Lower Austria and Styria, a border that goes back centuries. During most of the regencies of the houses of Babenberg and Habsburg (from 975 to 1918), these provinces were two independent duchies. The area surrounding the primeval forest was the only part of the Duchy of Austria that drained towards Styria. Together with the flat terrain in the lower parts of the primeval forest, this was a major obstacle for the transportation of wood using gravity and water.

View from the Dürrenstein summit (1,878 m above sea level) southward, towards Styria, illustrating the remoteness of the area today.

In the immediate vicinity of the Urwald Rothwald, we find another interesting historical piece in the puzzle of why it remained undisturbed for so long: three different creeks, all of them named “Lassing.” This situation caused legal battles over the correct border between Austria and Styria and between the neighboring monasteries Gaming and Admont, that continued for 337 years. Starting in 1332, the land around the primeval forest belonged to the monastery in Gaming, together with 30,000 hectares of property endowed by the Habsburg Duke Albrecht II. The conflict with Admont concerned hunting and grazing rights, as forestry did not play a role at that time. In 1689 the dispute was settled by an agreement to alternate the right of use annually between the monasteries; i.e., the rent for grazing was shared.

Land Owner	Era spanning from... - to...	Area of primeval forest cut	Exploitation rate ha/yr
Carthusian Monks	1332 – 1782	530 ha	1.2
Governmental Administration	1782 – 1825	650 ha	15.1
Earl Festetics de Tolna	1825 – 1869	950 ha	21.6
Industrie AG	1869 – 1875	150 ha	25.0
Rothschild family and descendants	1875 – now	20 ha	0.1

History of land ownership, area of primeval forest cut, and exploitation rate per year during each era. Information from old forest records and maps. Note the different lengths of periods. "ha" stands for hectares.

In 1782, the monastery in Gaming was expropriated by the first enlightened ruler of the Habsburg lands, Josef II. In the following ninety years, 1,650 hectares of primeval forest were removed, until Albert Rothschild put forest use to a halt. Unfavorable circumstances for timber extraction (terrain, political boundaries, and economic disputes over land between monasteries) helped to postpone exploitation long enough, so that this man with passion and foresight could save the most prominent primeval forest of the Alps until modern nature

conservation legislation took over. Today, the Urwald Rothwald represents the origin and centerpiece of the Wilderness Area Dürrenstein (IUCN category I) encompassing an area of 3,500 hectares.

Typical scenery beneath the closed canopy. The red ribbon on an old beech (*Fagus sylvatica*) stems from research activities.
